

Power BI Modular Data Model Report

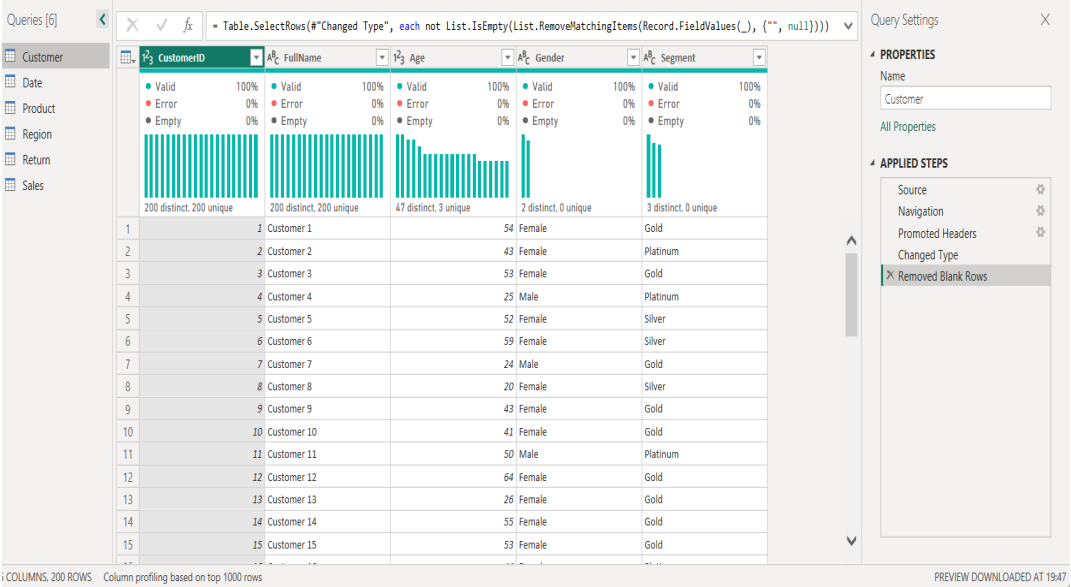

Author: Arnob Maity

Course: BCA / Data Analytics & AI■ML

Tool: Power BI

Customer Table

The Customer table acts as a dimension table containing customer-related details such as CustomerID, Full Name, Age, Gender, and Segment. This table is cleaned using Power Query by removing blank rows and correcting data types. It helps analyze sales based on customer demographics.

Date Table

The Date table is a time dimension table that enables time-based analysis. It includes DateKey, Date, Month, Quarter, Year, and Fiscal Year. This table allows filtering and comparison of sales data across different periods.

Promoted Headers

Changed Type

Removed Blank Rows

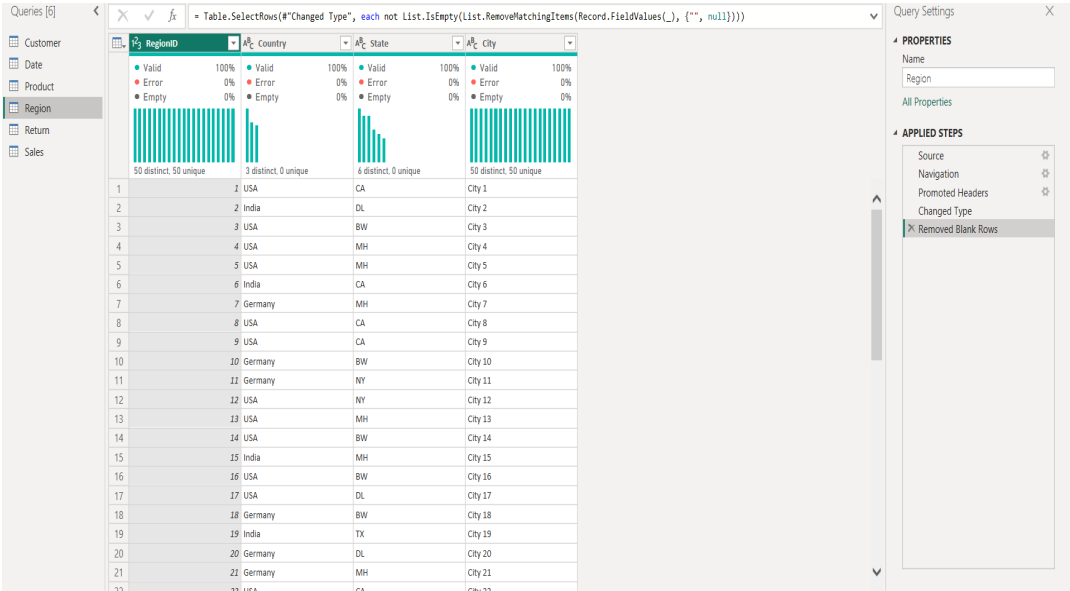

Product Table

The Product table stores product master data such as ProductID, Product Name, Category, Subcategory, and Brand. It enables product-wise and category-wise sales analysis.

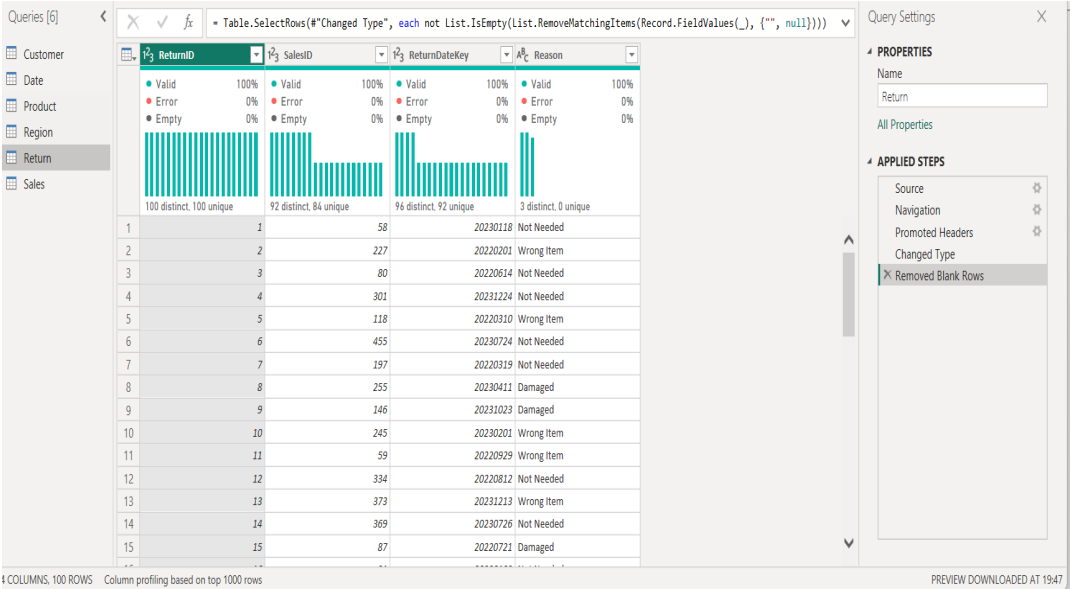

Region Table

The Region table contains geographical information including RegionID, Country, State, and City. This table supports region-wise sales performance and geographic comparison.

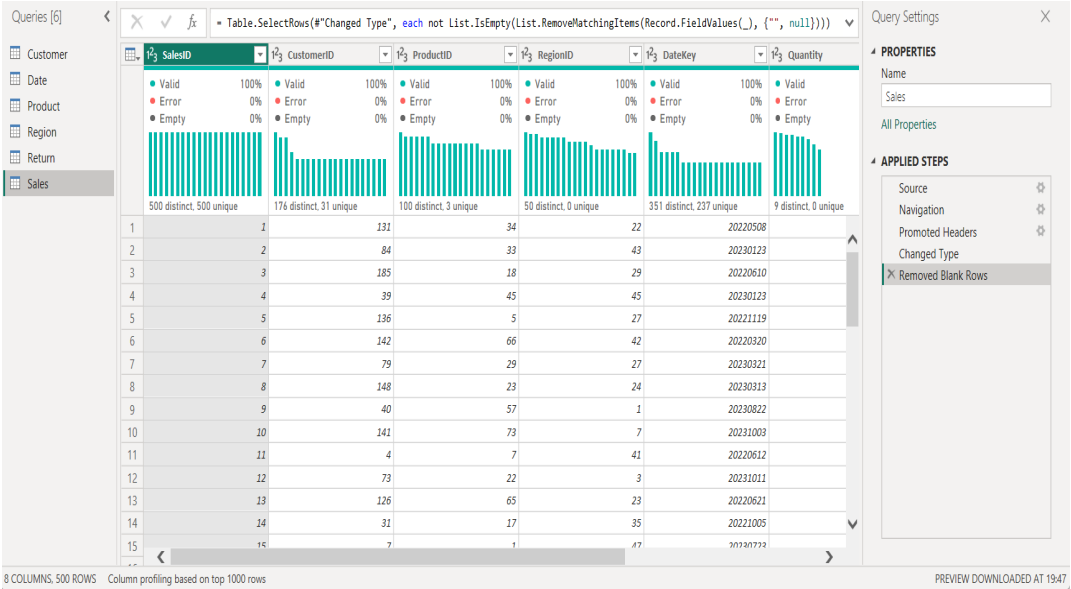

Return Table

The Return table records returned sales transactions along with reasons such as Wrong Item, Damaged, or Not Needed. It helps analyze return patterns and customer behavior.

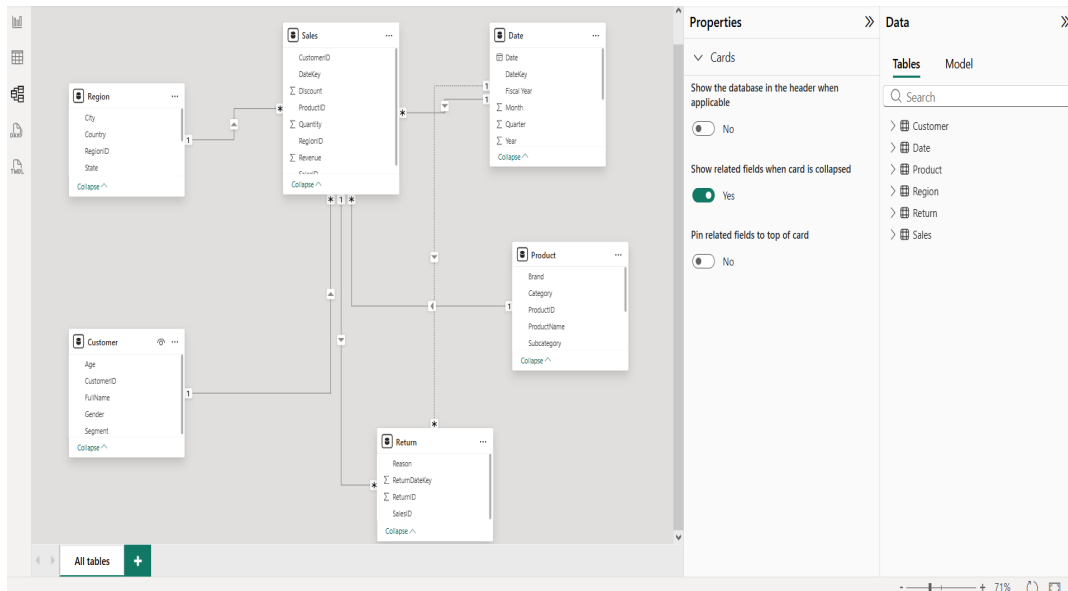

Sales Table

The Sales table is the central fact table containing SalesID, CustomerID, ProductID, RegionID, DateKey, and Quantity. It connects with all dimension tables and forms the foundation for analysis.

Data Model (Star Schema)

The data model follows a star schema design where the Sales table acts as the fact table connected to Customer, Date, Product, Region, and Return tables. This structure improves performance and simplifies reporting.

Dashboard & Insights

The final dashboard presents key insights such as total revenue, sales by category, country-wise performance, customer segment analysis, and return trends. These visuals help in quick decision-making.
